

Bridging The Great Divide in Sustainability Science: Linking High-Performance Modeling and Transition Experiments to Foster Transformational Change Towards Sustainability

Initiative: zukunft.niedersachsen (nur ausgewählte Ausschreibungen)

Ausschreibung: Spitzenforschung in Niedersachsen – Vorbereitung für eine neue Bund-Länder-Initiative

Bewilligung: 22.02.2016

Laufzeit:

Sustainability challenges threaten the long-term viability and integrity of societies around the world. While the theoretical understanding of these challenges continues to grow, solutions are far less developed. In response, sustainability science has been developing a research agenda that focuses on evidence-based solutions that are scalable and transferable. Yet, there is still a significant gap between understanding complex challenges and contributing to context specific solutions. This proposal aims to build additional capacity at Leuphana University of Lüneburg to bridge the divide between (i.) modeling and understanding of complex sustainability problems (often on a global scale), and (ii.) developing and evaluating contextualized solution efforts (often on a local scale). Focusing on water, land-use, and climate change challenges, two prominent approaches will be combined: high-performance computational modeling and transition experiments. Combining these two approaches and supporting interdisciplinary collaboration across the related academic communities while building on disciplinary excellence defines the agenda for a future cluster of excellence. This will also be a major leap towards bridging the knowledge-action gap in sustainability science. These questions will be addressed by adopting an interdisciplinary research framework that structures the knowledge-action loop by linking: (A) data-driven screening for suitable locations and contexts to make transition experiments more effective and efficient; (B) ex-ante testing of transition strategies to improve their performance and impact; (C) generalizing context-specific insights about solutions from transition experiments, including ex-post evaluations, to advance scalability and transferability; and (D) up-scaling findings from transition experiments into high-performance computational models to improve their validity, transferability, and explanatory power. Mobile Solution Theaters will be developed as advanced collaborative settings to facilitate activities and synthesize insights across the loop. A media culture and critical epistemology perspective will allow reflecting on assumptions and implications across the loop. Finally graduate and postgraduate junior researchers will be trained in innovative research-teaching settings across the loop, and thereby in bridging the great divide in future sustainability science.

Projektbeteiligte

Prof. Dr. Daniel Lang

Leuphana Universität Lüneburg
Fakultät Nachhaltigkeit
Institut für Ethik und Transdisziplinäre
Nachhaltigkeitsforschung
Lüneburg

Prof. Dr. Manfred Laubichler

Arizona State University
School of Life Sciences
Tempe, AZ
USA

Prof. Dr. Klaus Kümmerer

Leuphana Universität Lüneburg
