

Sentence comprehension as a cognitive process: A computational approach

Initiative: Opus Magnum

Bewilligung: 05.04.2016

Laufzeit: 2 Jahre

Projekt-Website: <https://github.com/vasishth/sccp>

Das Opus Magnum ist 2021 erschienen: Shravan Vasishth: "Sentence Comprehension as a Cognitive Process: A Computational Approach", Cambridge University Press The monograph titled "Sentence Comprehension as a Cognitive Process: A Computational Approach" aims to explore the broader empirical consequences of a computational model of sentence comprehension processes that is based on a general architecture of cognition, ACT-R. The book will explore four major current themes in sentence comprehension research through the lens of this computational model: (a) the interaction of eye-movement control and parsing, (b) impaired sentence comprehension processes in aphasia, (c) underspecification in sentence comprehension as a function of task demands, and (d) the role of individual capacity-based differences in building syntactic structure. It will also serve as a practical guide, providing easy-to-use tools that allow other researchers to explore the predictions of the computational model in novel research settings.
